                                                 The present sequence is a cDNA encoding rice adenylyIsulphate kinase (APS kinase), also known as adenosine-5' phosphosulphate kinase. This is obtained from clone r10n.pk112.oll, derived from rice 15 day leaf, r10n cDNA library. APS kinase is a sulphate assimilation protein, that catalyses the conversion of adenosine-5' phosphosulphate (APS) to 3'-Phospho-adenosine-5' phosphosulphate (APS) to assimilation proteins from other plants. It is also used to produce ransgenic plants, that are useful for altering the expression levels of a sulphate assimilation protein. The APS kinase peptides are useful for producing antibodies, that are used to screen and isolate cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         185

"dev_Stage="roots harvested at 10 days post inoculation with Phytophthora medicagin1s"

"Ala_Dost="E. col1 strain XIOLR"

//na_Lost="E. col1 strain XIOLR"

//note="vector: pBluescript SK-; Site_1: EcoRI; Site_2:
XhoI; cDNA was prepared from polyA+ enriched RNA from roots harvested at 10 days post inoculation with Phytophthora medicagin1s. The cDNA was directionally ligated into the Uni-2AP XR vector from Stratagene and packaged using Gigapack III Gold packaging extracts.
Plasmids containing cDNA inserts were excised from the recombinant lambda "ARP phage using Ex-Assist helper phage and propagated in XLOLR cells. Note: EST may be of fungal
                                                                                                                                                                                                                                                                                                                         Phytophthora medicaginis

Dr. Gary Stacey generously donated the tissue. The roots were flash-frozen in liquid nitrogen. Stratagene's cDNA Synthesis Kit (catalog number 200401) was used to synthesize the cDNA. First-strand

Another Vector: lambdaZAP, Site_1: EcoR1; Site_2: Xho1; Seeds were surface sterilized then germinated under axenic conditions in the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization dishes. Five-day old seedlings were incubated at 90% HR for 24 hr. Shoots were then harvested, total RNA was prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, 600000 pfu were in vivo excised to give pluscrift SK(·) cDNA pingemids. These steps were performed in the TJ Close laboratory at the University of California, Riverside (Choi, Close,

Development of a genetically and physically anchored EST resource for barley genomics: Morex drought-stressed seedling shoot cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fencion). Phaggmids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Anote—Vector: paluescript II SK+; Site_I: ECORI; Site_2: XND: The Clark NIL was constructed and seed was provided by Dr. J. Specht, University of Nebraska (Shoemaker and Specht, 1995). The CDNA library was constructed from mRNA isolated from whole seedlings of 3 week old greenhouse grown plants. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dr) sequence with a XND restriction site and a 3' anchor. EcoRi adapters were ligated to the Dlunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the ECORI.XhoI restriction site of the plluescript vector. The ligated cDNA fragments were transformed into DH108 host cells (GibcoBRL). The library was constructed in cooperation with Dr. Paul Keim's laboratory at Northern Arizona University.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Email: est@watson.wustl.edu

```
The present sequence is the corn adenylylsulphate kinase (APS kinase), also known as adenosine-5' phosphosulphate kinase. It is obtained from colone cenān. pyk0088 blo, derived from corn endosperm, cenān cDNA library. This has 70% sequence identity to Catharanthus roseus APS kinase. APS kinase is a sulphate assimilation protein, that catalyses the conversion of adenosine-5' phosphosulphate (APS) to 3'-Phospho-adenosine-5' phosphosulphate (PAPS). The nucleotide sequence is used as probes and primars to identify, obtain and synthesise sulphate assimilation proteins from other plants. It is also used to produce transgenic plants that are useful for altering the expression levels of a sulphate assimilation protein. The APS kinase peptides are useful for producing antibodies, that are used to screen and isolate cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Adenylylsulphate kinase; Adenosine-5'phosphosulphate kinase; APS kinase; 3'-Phospho-adenosine-5'phosphosulphate; PAPS; sulphate assimilation; wheat; clone wrl.pk0101.e2; transgenic plant; screen; antibody.

                                                             The present sequence is the corn adenylylsulphate kinase (APS kinase), also known as adenosine-5' phosphosulphate kinase. This is obtained from clone p0016.ctscj40rb, derived from corn pooled tassel shoots, p0016 corn booled tassel shoots approach that catalyses the conversion of adenosine-5' phosphosulphate (APS). The nucleotide sequence is used as probes and primers to identify, obtain and synthesise sulphate assimilation proteins from other plants. It is also used to produce transgenic plants, that are useful for altering the expression levels of a sulphate assimilation protein. The APS kinase peptides are useful for producing antibodies, that are used to screen and isolate cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Adenylylsulphate kinase; Adenosine-5'phosphosulphate kinase; APS kinase; 3'-Phospho-adenosine-5'phosphosulphate; PAPS; sulphate assimilation; corn; clone cen3n.pk0088.bl0; transgenic plant; screen; antibody.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Adenylylsulphate kinase; Adenosine-5'phosphosulphate kinase; APS kinase; 3'-Phospho-adenosine-5'phosphosulphate; PAPS; sulphate assimilation; soybean; clone sdp2c.pk013.a11; transgenic plant; screen; antibody.
                                                                                                                                                                                              The present sequence is the wheat adenylyisulphate kinase (APS kinase), also known as adenosine-5' phosphosulphate kinase. This is obtained from clone wrl.pk0101-2, derived from 7 day old light grown wheat root seedlings, wrl cDNA library. This sequence has 63% sequence identity to Catharanthus roseus APS kinase. APS kinase is a sulphate assimilation protein, that catalyses the conversion of adenosine-5' phosphosulphate (AAPS) to 3'-Phospho-adenosine-5' phosphosulphate (PAPS) to 3'-Phospho-adenosine-5' phosphosulphate (AAPS) to 3'-Phospho-adenosine-5' phosphosulphate assimilation proteins from other plants. It is also used to produce transgenic plants, that are useful for altering the expression levels of a sulphate assimilation protein. The APS kinase peptides are useful for producing antibodies, that are used to screen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EKPVMSNIGKSTNILWHNCLIGQSDRQKLLGQKGCVVWITGLSGSGKSTLACALSRELHC 192

The present sequence is the soybean adenylylsulphate kinase (APS kinase), also known as adenosine-5' phosphosulphate kinase. This is obtained from clone sdp2c.pk013.all, derived from soybean developing pods, sdp2c cDNA library. This has 56% sequence identity to catharanthus roseus APS kinase. APS kinase is a sulphate assimilation protein, that catalyses the conversion of adenosine-5' phosphosulphate (APS) to 3'-phosphosulphate (APS). The nucleotide sequence is used as a probe and primer to identify, obtain and synthesise sulphate assimilation proteins from other plants. It is also used to produce transgenic plants, that are useful for altering the expression levels of a sulphate assimilation protein. The APS kinase peptide are useful for producing antibodies, that are useful coreen and isolate cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
